Robert H. Foglesong, President • Mississippi State University • Vance H. Watson, Vice President

## **NOTICE TO USER**

This Mississippi Agricultural and Forestry Experiment Station information bulletin is a summary of research conducted under project number 171440 at the Delta Research and Extension Center in Stoneville, Mississippi, and several other locations in the state. It is intended for the use of colleagues, cooperators, and sponsors. The interpretation of data presented herein may change after additional experimentation. Information included herein is not to be construed either as a recommendation for use or as an endorsement of a specific product by Mississippi State University or the Mississippi Agricultural and Forestry Experiment Station. Trade names of commercial products used in this report are included only for clarity and understanding. All available names (trade names, chemical names, experimental product code names or numbers, etc.) of products used in this research project are listed in the tables contained in this report.

### **ACKNOWLEDGMENT:**

Most of the variety trial locations are on research stations throughout the state. Trials that are planted on commercial farms give an added dimension to the results. While on-farm trials present logistical obstacles to researchers and to producer-cooperators, data from these trials give an important indication of how varieties will perform in real world situations. The authors wish to express their appreciation to Dr. Don Parker of the Raymond Experiment Station, Robert Sullivan and Jim Nichols of the Cotton Improvement Program at Delta Research and Extension Center for their technical assistance, Dr. Pat Gerard for his statistical assistance, and also to the Mississippi cotton producers who allowed us to conduct these variety trials on their farms and often put up with the aggravation of farming around small-plot research:

George Perry, Tunica            Cliff Heaton, Clarksdale  
Clark Carter, Rolling Fork      John Henry Miller, Nesbit

## Introduction

Variety selection is one of the first decisions a cotton producer makes each season, and perhaps the single most important. Results from this research are intended to be an aid in making this crucial decision. Certain data will also be of interest to ginners, millers, and other sectors of the cotton industry. Results are reported for varieties submitted by cottonseed companies wishing to participate in the trial.

All varieties, regardless of transgenes present, were evaluated in tests under standard management practices, including chemical control of insects with conventional insecticides. Tests are designed to estimate variety yield potential and not potential advantages offered by transgenic traits or a particular “production system”.

In all tests, seed of each variety was supplied by the company that desired to participate in the trial. Recommended management practices were followed in each test. The on-farm cooperators decided planting dates, fertilizer rates, amount of supplemental irrigation, defoliation date, insect, and weed control strategies, and harvest date. These tests do not encompass all growing and environmental conditions in the state, but they provide a guide to producers in selecting among varieties best suited for their growing conditions.

Varieties submitted for testing were divided into two groups based on maturity as determined by the company submitting each variety. The Early-Maturity Cotton Variety Test was comprised of 38 varieties and the Mid-Maturity Cotton Variety Test was comprised of 23 varieties. The New Entry Test was comprised of 23 varieties. Deltapine 555 BG/RR, Deltapine 444 BG/RR, FiberMax 960 BR and Stoneville 5599 BR were included as check varieties in all trials.

The Early-Maturity and Mid-Maturity Variety Tests were conducted at five Delta and four Hill locations: Stoneville, Clarksdale, Rolling Fork, Tribbett, Tunica, Brooksville, Nesbit, Raymond, and Verona. The New Entry Test was conducted at two Delta and two Hill locations: Stoneville, Tribbett, Brooksville, and Verona. The New Entry Test provides for the evaluation of varieties not previously tested in the Mississippi Variety Trial but are scheduled for commercial release within one year.

All test plots consisted of two rows, 40 feet in length, with a row spacing of 38 or 40 inches. Experimental design for each trial consisted of a Randomized Complete Block with 4 replications. Yield determinations were based on the weight of seed cotton mechanically harvested from two-row plots. Estimation of lint percentage, boll size, seed index (weight in grams of 100 fuzzy seed), and fiber properties was based upon hand-picked 50-boll samples from 4 replications at each location. Samples were ginned on a 10-inch saw laboratory gin. HVI fiber property determinations were made by Starlab, Inc., Knoxville, TN.

At the bottom of each table are summary of statistics, which are very important in interpreting the test results. Despite efforts to provide a uniform test environment, all

experiments are subject to a certain degree of error due to variation between plots arising from differences in soil type, fertility, insect damage, weed pressure, etc. Therefore, yield potential (and performance with respect to other characteristics) cannot be measured with complete accuracy. By conducting replicated trials we can account for or remove some, but not all of the effect of non-uniform conditions among plots. As a result, the mean performance of some varieties may be numerically different, but not statistically different when variability in the test is taken into account. The Least Significant Difference (LSD) value estimates the smallest difference between two varieties that should be considered something other than natural variation. For example, if the LSD for lint yield in a given trial is 80 lb/A, varieties that differ by less than 80 lb/A should not be considered different.

The coefficient of variation (CV) is a measure of relative precision of a given trial and is generally considered to be an estimate of the amount of unexplained variation in that trial. In general, the higher the CV value, the less precise a given trial. The  $R^2$  value is another measure of relative precision. The higher the  $R^2$  value, the more precise a given trial.

### Results and Conclusions

The 2006 growing season was abnormally hot and dry. Even though the Stoneville and Tribbett locations were irrigated, these locations still experienced severe water stress. Plant bugs and spider mites were also problems at several locations and most likely had an impact on yield. In any single year or location, a given variety may perform extremely well or extremely poorly due either to chance variation or to its response to environmental conditions in that particular site and year. In order to avoid being misled by performance in a single year and location, it is wise to base variety selection decisions on as many environments as possible. While it is hoped that newer varieties will perform better than older varieties, this is not always the case. Greater confidence can be put in varieties that have performed well over two or more years than can be put in varieties that are in their first year of testing. Producers should consider these new varieties/technologies as not being thoroughly evaluated until multiple year, multiple locations results are available.

<sup>†</sup>A color and leaf grade of 41-2 was assumed for all calculations.<sup>††</sup>Estimates based upon a seed value of \$80 per ton.

<sup>†</sup> **Loan Price** was determined by entering OVT fiber data into the **Cotton Loan 2006 Calculator**. The Loan Calculator was developed through funding from Cotton Incorporated by Dr. Larry Falconer, Texas A&M Corpus Christi. The values are based on **USDA** premium and discount schedules for cotton entering the **Commodity Credit Corporation (CCC)** loan program (US National Loan Rate is \$0.52 per lb of lint for standard fiber characteristics). The information presented presumes a **standard leaf and color grade** since this information is needed to calculate the values and is not available from OVT data. **Color and leaf grade different than standard grades might affect the results.** Value per Acre is simply the Loan Price multiplied by the lint yield per acre.

<sup>†</sup> A color and leaf grade of 41-2 was assumed for all calculations.

<sup>††</sup> Estimates based upon a seed value of \$80 per ton.

<sup>†</sup>Loan Price was determined by entering OVT fiber data into the **Cotton Loan 2006 Calculator**. The Loan Calculator was developed through funding from Cotton Incorporated by Dr. Larry Falconer, Texas A&M Corpus Christi. The values are based on **USDA** premium and discount schedules for cotton entering the **Commodity Credit Corporation (CCC)** loan program (US National Loan Rate is \$0.52 per lb of lint for standard fiber characteristics). The information presented presumes a **standard leaf and color grade** since this information is needed to calculate the values and is not available from OVT data. **Color and leaf grade different than standard grades might affect the results.** Value per Acre is simply the Loan Price multiplied by the lint yield per acre.

<sup>†</sup>A color and leaf grade of 41-2 was assumed for all calculations.<sup>††</sup> Estimates based upon a seed value of \$80 per ton.

<sup>†</sup>**Loan Price** was determined by entering OVT fiber data into the **Cotton Loan 2006 Calculator**. The Loan Calculator was developed through funding from Cotton Incorporated by Dr. Larry Falconer, Texas A&M Corpus Christi. The values are based on **USDA** premium and discount schedules for cotton entering the **Commodity Credit Corporation (CCC)** loan program (US National Loan Rate is \$0.52 per lb of lint for standard fiber characteristics). The information presented presumes a **standard leaf and color grade** since this information is needed to calculate the values and is not available from OVT data. **Color and leaf grade different than standard grades might affect the results.** Value per Acre is simply the Loan Price multiplied by the lint yield per acre.
